

Danio flagrans Kullander 2012

© Ralf Britz.

Scientific Name	<i>Danio flagrans</i>
Common Name	<i>Danio cf choprae</i> , <i>Danio sp. Putao</i> .
Origin	Headwaters of the River Mali Hka near Putao. Northern Myanmar.
Size	40mm
Comments	It is not easy to readily distinguish between <i>Danio choprae</i> and the slightly larger <i>Danio flagrans</i> . Careful observation will show that <i>Danio flagrans</i> has longer barbels, longer caudal peduncle and fewer anal fin rays. Colour patterns are similar though that of <i>Danio flagrans</i> is somewhat less intense. This is a species which is seen quite rarely. The above picture was taken immediately after capture.
