

## *Danio jaintianensis* Sen 2007.

© Kamphol Udomrittiruj

Scientific Name	Danio jaintianensis
Common Name	None known,
Origin	The Rangriang Jowai. Jaintia Hills District Meglahaya.
Size	Up to 65 mm S.L.
Comments.	This species was originally (incorrectly) named as <i>Brachydanio jaitianensis</i> . It has two pairs of well-defined barbels and is noted for the brilliant orange / gold stripe along its flanks. In breeding condition, the males are predominantly red. It is a cool water species and should be kept at less than 23°C. It is a species that I find very difficult to keep! This species has only limited availability and is always expensive! It was first bred by Hans Georg Evers.
